

JOB DESCRIPTION

Sonographers are highly-skilled professionals who create specialized images of the body's organs and tissues. Those images are used by physicians to make a medical diagnosis.

Sonography is often the first imaging test performed when disease is suspected. Sonography uses high-energy sound waves to produce images of the inside of the body. The field of sonography offers several areas of specialization, including: Abdomen, Breast, Musculoskeletal, Pediatric sonography, Obstetrics/Gynecology, and Vascular Technology.

Diagnostic medical sonographers typically do the following:

- Prepare patients by explaining the procedure and answering questions
- Prepare exam rooms and maintain diagnostic imaging equipment
- Properly position patients for imaging
- Operate equipment to obtain diagnostic images
- Review images to check for quality and coverage of the areas needed for diagnoses
- Analyze results for abnormalities and provide a summary of findings to physicians
- Record findings and keep track of patients' records

- **Physical stamina.** Diagnostic medical sonographers stand for long periods and must be able to lift and move patients as needed.
